# Pond / Earthen Dam Repair

*Before*

*Water Leaking  
thru Pond Wall*

*After*

1. Locate leak after a rain storm by walking around the waters edge. Stirring up mud and silt as you go. You will notice this will get drawn into the hole when you get near it. Pond will obviously stop leaking after water level drops below the hole.

2. Mix 4 parts HyperFlex to 1 part water in a bucket - stir well.

3. Pour the HyperFlex / Water mixture over the leaking area, allowing the water to draw the HyperFlex into the paths the water is leaking through.

4. The amount of HyperFlex necessary depends, of course, on the volume that must be filled.

Call Seal Guard if you have questions about how much may be required.
